Test Name	Results
<b>COVID</b>	
COVID-19 PCR	COVID-19 RNA Not Detected
Qualitative	(Negative).

This Real-Time PCR test was performed on FDA approved kit with high performance standards. The reagents used meet international standards and give reproducible results.

Note: Results of Covid-19 RNA tests carried out in different labs may not be compared with each other due to difference in specimen collection, transport, storage ,sensitivity, specificity and quality controls carried out by individual labs.

A negative result indicates that there was no Corona virus in the submitted sample. A negative sample can occur early in the disease process, if there is a history of exposure to a known case or presence of fever/cough a repeat test in 48-72 hours can help confirm absence of this infection.

Normal tests are verified by a Senior Technologist and do not require a signature
